

Danger and Target Movement

Directions: Use the Design Recipe to write a function `update-danger`, which takes in the danger's x-coordinate and produces the next x-coordinate.

Contract and Purpose Statement

Every contract has three parts...

<code>; update-danger :</code>	<code>Number</code>	<code>-></code>	<code>Number</code>
<i>function name</i>	<i>domain</i>		<i>range</i>

what does the function do?

Examples

Write some examples, then circle and label what changes...

(EXAMPLE (update-danger 160) (- 160 50))

function name *input(s)* *what the function produces*

(EXAMPLE (update-danger -85) (- -85 50))

function name *input(s)* *what the function produces*

Definition

Write the definition, giving variable names to all your input values...

$$\begin{array}{c} \text{(define (update-danger } \underline{\hspace{2cm}} \underline{\hspace{2cm}} \text{ x)} \\ \hspace{1.5cm} \textit{function name} \hspace{1.5cm} \textit{variable(s)} \\ \text{(- x 50)} \\ \hline \hspace{15cm} \textit{what the function does with those variable(s)} \end{array}$$

Directions: Use the Design Recipe to write a function `update-target`, which takes in the danger's x-coordinate and produces the next x-coordinate.

Contract and Purpose Statement

Every contract has three parts...

; update-target :	Number	->	Number
<i>function name</i>	<i>domain</i>		<i>range</i>

what does the function do?

Examples

Write some examples, then circle and label what changes...

(EXAMPLE (update-target 130) (+ 130 50))

function name *input(s)* *what the function produces*

(EXAMPLE (update-target -25) (+ -25 50))

function name *input(s)* *what the function produces*

Definition

Write the definition, giving variable names to all your input values...

```
(define (update-target x)  
      (+ x 50)  
      what the function does with those variable(s)
```
