Grouped Samples from the Animals Dataset

Use method chaining to define the grouped samples below, using the helper functions that you've already defined: is-old, is-young, is-cat, is-dog, is-female, lookup-fixed, and has-s-name. We've given you the solution for the first sample, to get you started.

Subset	The code to define that subset
Kittens	kittens = animals-table.filter(is-cat).filter(is-young)
Puppies	young-dogs = animals-table.
Fixed Cats	fixed-cats = animals-table.
Cats with "s" in their name	s-cats = animals-table.
Old Dogs	old = animals-table.
Fixed Animals	fixed = animals-table.
Old Female Cats	old-cats = animals-table.
Fixed Kittens	young-fixed-cats = animals-table.
Fixed Female Dogs	fixed-female-dogs = animals-table.
Old Fixed Female Cats	old-fixed-female-cats = animals-table.
