## Word Problem: rocket-height

**Directions**: A rocket blasts off, traveling at 7 meters per second. Use the Design Recipe to write a function <code>rocket-height</code>, which takes in a number of seconds and calculates the height.

Con	tract and Purpo	se Stat	ement									
Every	contract has three pa	ırts										
#	::									->		
	function name					domain					range	<del></del>
#												
					wh	at does the fun	action do?					
Exar	mples											
Write	some examples, then	circle and	l label what cha	nges								
exam	ples:											
		(			)	is						
	function name		input(s)		_			what th	e function produ	ices		
		(			)	is						
end	function name		input(s)		_			what th	e function produ	ices		
Defi	nition											
Write t	the definition, giving	variable n	ames to all your	input v	alues.							
fun		(		):								
	function name		variable(s)									
on d				what the	e func	ction does with	those variabl	le(s)				
end
