## The Design Recipe

rections : Define a function called		, which consumes a Row of
	table and produces	
ontract and Purpose Statement		
ry contract has three parts		
::	Row	-> Boolean
function name	domain	range
	what does the function do?	
camples		
te some examples, then circle and label what	t changes	
amples:		
(	) is	
function name input(s	<u> </u>	what the function produces
(	) is	
function name input(s	s)	what the function produces
d		
efinition		
te the definition, giving variable names to all	your input values	
n (	):	
function name variable(s)		
	what the function does with those variable(s)	
d	what the function does with those variable(s)	
	what the function does with those variable(s)	, which consumes a Row of
d rections: Define a function called	what the function does with those variable(s)  table and produces	, which consumes a Row of
rections : Define a function called		, which consumes a Row of
rections: Define a function called ontract and Purpose Statement		, which consumes a Row of
rections : Define a function called	table and produces	
rections: Define a function called ontract and Purpose Statement ry contract has three parts ::	table and produces	-> Boolean
rections: Define a function called ontract and Purpose Statement	table and produces	
rections: Define a function called ontract and Purpose Statement ry contract has three parts ::	table and produces  Row  domain	-> Boolean
pontract and Purpose Statement ry contract has three parts :: function name	table and produces	-> Boolean
pontract and Purpose Statement ry contract has three parts :: function name	Row domain what does the function do?	-> Boolean
pontract and Purpose Statement ry contract has three parts :: function name  (camples the some examples, then circle and label what	Row domain what does the function do?	-> Boolean
pontract and Purpose Statement ry contract has three parts :: function name	Row domain what does the function do?	-> Boolean
pontract and Purpose Statement ry contract has three parts :: function name  (camples te some examples, then circle and label what amples:	table and produces  Row domain  what does the function do?	-> Boolean range
pontract and Purpose Statement ry contract has three parts :: function name  (camples the some examples, then circle and label what	table and produces  Row domain  what does the function do?	-> Boolean
pontract and Purpose Statement ry contract has three parts :: function name  te some examples, then circle and label what amples:  ( function name  ( input(s	table and produces  Row domain  what does the function do?  t changes  ) is  ) is	-> Boolean range
